AJAX XML: The PHP File

Select a course: ▼

Course information will be listed here.

The page on the server called by the JavaScript is a PHP file called getCourse.php as below, which loads an XML document, courseList.xml, runs a query against the XML file, and returns the result as HTML. When the course query is sent from the JavaScript to the PHP page, the following happens:

- 1. PHP creates an XML DOM object.
- 2. Find the number element that matches the course number sent from the JavaScript.
- 3. Output the course information (send to the txtHint placeholder)

```
01
   <?php
02
      q = GET["q"];
      $xmlDoc = new DOMDocument( );
03
      $xmlDoc->load( "courseList.xml" );
04
      $x = $xmlDoc->getElementsByTagName( 'number' );
05
      for ( $i=0; $i<=$x->length-1; $i++ ) {
06
07
        // Process only element nodes.
        if ( $x->item($i)->nodeType == 1 ) { // 1: element
80
          if ( $x->item($i)->childNodes->item(0)->nodeValue == $q ) {
09
            y = (x-)item(xi)-parentNode);
10
11
12
13
      $course = ( $y->childNodes );
14
15
     for ( $i=0; $i<$course->length; $i++ ) {
        // Process only element nodes.
16
        if ( $course->item($i)->nodeType == 1 ) {
17
         echo( $course->item($i)->nodeName . ":" );
18
19
          echo( $course->item($i)->childNodes->item(0)->nodeValue );
20
```
